INSORB[®]
ABSORBABLE STAPLE

The INSORB Absorbable Staple is comprised of a polylactide/polyglycolide co-polymer with a well established history in wound closure. Now, 25% stronger!

INSORB[®] | 25
SUBCUTICULAR SKIN STAPLER

The patented INSORB Skin Stapler is a sterile, single patient use device that deploys 25 absorbable staples, sufficient to close an incision up to 25 cm in length.

“In conclusion, the closure of contaminated wounds with the INSORB Staples is a superior choice to [the braided absorbable] suture because they have a significantly (p=0.009) lower incidence of infection. The INSORB Staple is a revolutionary advance in subcuticular skin stapling.”

Peer Review Journal Article

“The absorbable stapler has reduced our major procedure times by as much as 40 minutes, enhancing our productivity and saving money.”

Medical Director
Plastic and Reconstructive Surgery

“Our clinical experience to date demonstrates that the INSORB Stapler is a superior alternative to metal skin staples and subcuticular suturing in terms of reduction in operative and anesthesia times, reduction in wound complications, elimination of needlesticks, and elimination of the need to remove staples post-operatively, and is significantly preferred by patients. We have experienced only 1 seroma and 1 hematoma to date with the INSORB Stapler in over 380 patients”

Obstetrics & Gynecologic Surgeon

“[Histologic] results indicate that absorbable staples induce a less severe inflammatory response [with minimal scarring] in the early stages of healing in pigs, compared to other commonly used methods of wound closure. Use of absorbable staples potentially combines the benefits of a subcuticular closure with the speed and precision of staple placement.”
